The invention relates to a DNA construct (I) a second (F2) expression cassette. F1 of the

comprising a first (F1) and DNA construct, in operable

Claim 8; Page 3; 25pp; English

Novel DNA construct useful for producing a corn plant that tolerates application of glyphosate herbicide, comprises two transgene expression

WPI; 2002-165871/22.

Also included are two DNA sequences from corn plant PV-ZMGT32(nk603) of 498 or 1183bp, or primers and probes derived from them (used to detect transgene junction points). The construct is useful for producing a corn plant that tolerates application of glyphosate tolerance to application of glyphosate, and growing the corn cell for tolerance to application of glyphosate, and growing the corn cell into a fertile corn plant. The present sequence is a transgene junction probe sequence consisting of corn genomic DNA and vector sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a DNA construct (I) comprising a first (F1) and a second (F2) expression cassette. F1 of the DNA construct, in operable linkage, has rice actin 1 (RA1) promoter, RA1 intron, chloroplast transit peptide gene (II), 9lyphosate tolerant 5-enol-pyruvylshikimate-3-phosphate synthase (RPSPS) gene (III), and transcriptional terminator (IV), and F2 has cauliflower mosaic virus 35S promoter, Hsp70 intron, (III), (III) and (IV). Also included are two DNA sequences from corn plant by-ZMGT32(nk603) of 498 or 1183bp, or primers and probes derived from them (used to detect transgene junction points). The construct is useful for producing a corn plant that tolerates application of glyphosate herbicide by transforming a corn cell with, selecting the corn cell for colerance to application of glyphosate, and growing the corn cell into a fertile corn plant. The present sequence is the 1183bp amplicon consisting of the Agrobacteium transcriptional terminator sequence,
                                                    New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutation responsible for genetic disorders or other traits and to assess biodiversity.

(I) is useful as hybridisation probes, polymerase chain CC reaction (PCR) primers, oligomers, and for chromosome and gene mapping, CC and in recombinant production of (II). The polynucleotides are also used CC in diagnostics as expressed sequence tags for identifying expressed CC genes. (I) is useful in gene therapy techniques to restore normal CC activity of (II) or to treat disease states involving (II). (II) is CC useful for generating antibodies against it, detecting or quantitating a CC polypeptide in tissue, as molecular weight markers and as a food CC supplement. (II) and its binding partners are useful in medical imaging CC involving aberrant protein expression or biological activity. The CC involving aberrant protein expression or biological activity. The CC diagnostics, forensics, gene mapping, identification of mutations CC diagnostics, forensics, gene mapping, identification of mutations CC coding sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invention. Note: The sequence data for this
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cc complementary strand of a polynucleotide which comprises a 5'-end complementary strand of a polynucleotide which comprises a 5'-end complementary to a sequence and an oligonucleotide comprising a sequence complementary to a compunity of the figural comprises a 1'-end sequence, where the complementary to a compunity of the figural comprises at least 15 nucleotides and the combination of the 5'-end sequence/3'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in comparison are useful antisense therapy and in comparison of the primers are useful for the particularly full-length cDNAs. The primers are also useful for the comparison of the sull-length cDNAs. The primers allow obtaining of the full-length cDNAs. The primers allow obtaining of the full-length cC cDNAs easily without any specialised methods. AAH03166 to AAH13628 and cc represent human amino acid sequences; and AAH13629 to AAH13632 represent coligonucleotides, all of which are used in the exemplification of the coligonucleotides, all of which are used in the exemplification of the

Where a primer set comprises:
(a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 1587 BP; 312 A; 416 C; 383

AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment. N.B. The SEQ ID NOS 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297 and
The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV00010-ABV62213) of the specification or its complement. (I) is useful for: (a) assessing whether a patient is affilicted with prostate cancer; (b) monitoring the progression of prostate cancer in a patient; (c) assessing the efficacy of a test compound to inhibit prostate cancer in a patient; (d) assessing
                                                                                                                                                                                                                    prostate

                                                                                                                                                                                                        capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL0176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB5737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly

C claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a composition of the perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound useful in treating pain and a pharmaceutical composition composition composition and a pharmaceutical composition composition the conductates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction confication; and spared nerve injury (SNI)) in an animal (e.g. gene therapy). The sequence presented is a human DNA (shown in Table 2 of the pharmacine of the polypeptides of the invention confication is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at continuous continuous continuous.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             14-AUG-2001; 2001US-0312147P.

                          cc or human polymucleotides or a polymucleotide which regresents a fragment, comprising the nucleic acid sequence. Also claimed are a vector comprising the novel polymucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence (which is differentially regulated in an animal subjected to pain and a ckit to perform the method, an array, a method for identifying an agent chat increases or decreases the expression of the polymucleotide sequence that is differentially expressed in neuronal tissue of a first animal cubjected to pain, a method for identifying a agent compound that regulates the activity of one or more of the regulates the expression of a polymucleotide sequence compound that regulates the activity of one or more of the composition, a method for identifying a compound which regulates the cativity in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the polymelates the compound or small molecule that regulates the cativity in an animal of one or more of the polypeptides given in the composition, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more complypeptides or their antibodies. The polymucleotide or the compound that modulates its activity is useful for preparing a medicament for treating cain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury). The sequence presented is a human DNA (shown in Table 2 of the specification) which encodes one of the polypeptides of the invention contained in electronic form part of the printed specification, but was cotained in electronic form mart of the printed specification, but was cotained in electronic form directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human;

(I) and (II) are useful for diagnosis. CC prognosis, prevention, and/or treatment of diseases and/or disorders of the prostate such as acute non-bacterial prostatitis, chronic non-cc bacterial prostatitis, acute bacterial prostatitis, prostatodystonia, prostatosis, granulomatous prostatitis, malacoplakia, benign prostatic CC hypertrophy or hyperplasia, and prostate neoplastic disorders, including CC adenocarcinomas, transitional cell carcinomas, ductal carcinomas, and CC squamous cell carcinomas. (I), (II) and antibody to (II) are useful for CC diagnosing and treating reproductive system disorders (Paget's disease), cutoimmune disorders (systemic lupus erythematosus, rheumatoid CC arthritis), blood-related disorders (sickle cell anaemia), hyperproliferative disorders, urinary system disorders (Paget's disease), cendocrine disorders, (Alzheimer's disease and Parkinson's disease), cendocrine disorders (Alzheimer's disease), cendocrine disorders (Alzheimer's disease), cendocrine disorders (Alzheimer's disease), cendocrine disorders (Alzheimer

The propertion of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention provides the protein and coding sequences of a number of human reproductive system related antigens. These can be use in the prevention and treatment of reproductive system disorders, including cancer. The present sequence is a genomic sequence encoding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Isolated nucleic acid molecule encoding a reproductive system antigen used in preventing, treating or ameliorating a medical condition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ABL09088 standard; cDNA; 3190
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 3167

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01940-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
The present invention describes isolated polynucleotide sequences (I), which encode polypeptides (II) with biological activity. Also described: (I) a vector comprising (I); (2) an expression vector comprising (I); (3) a host cell genetically engineered to comprise (I) which is operatively associated with a regulatory sequence that modulates expression of (I) in the host cell; (4) a polypeptide (II) encoded by (I); (5) as composition comprising the polypeptide of (4) and a carrier; (6) an antibody directed against the polypeptide of (4) and a carrier; (6) an antibody directed against the polypeptide of (4); (7) detecting (I) or the polypeptide of (4) in a sample; (8) identifying a compound that binds to the polypeptide of (4); (9) producing the polypeptide of (4); and (10) a collection of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Claim 1; SEQ ID NO 21746; 21pp + Sequence Listing; English

The polynucleotides (I) can be used as hybridisation probes, oligomers or primers, for chromosome or gene mapping, for the recombinant production of proteins, and for generating antisense DNA or RNA. The present sequence represents a human contrig polynucleotide sequence, which is used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human immune/haematopoietic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cytostatic;

                                                                                                                                                                                                              AAKS4951 to AAK64702 encode the human immune/haematopoietic antigen (I) camino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) cyroteins and polynucleotides may be used in the prevention, diagnosis and creatment of diseases associated with inappropriate (I) expression. For cerample, they may be used to treat disporders associated with decreased cexpression by rectifying mutations or deletions in a patient's genome created that affect the activity of (I) by expressing inactive proteins or to complement the patients own production of (I). Additionally, (I) colored and the patients of the polynucleotides may be used to produce the secreted (I), by inserting the colored and treat immune/haematopoietic-related diseases, especially concers and cancer metastases of haematopoietic actived cells. AAK64703 concers and cancer metastases of haematopoietic antigen genomic concers and cancer metastases of haematopoietic antigen genomi

The library was constructed by Claire Murphy and Dr. James McCarter

at Washington University, St. Louis. Oligo(dT)-SL1 PCR based

at Washington University, St. Louis. Oligo(dT)-SL1 PCR based

library. Embryo cDNA PCR products of size >400 nucleotides

containing SL1 on the 5' end and oligo(dT) on the 3' end were

non-directionally cloned into pCRII-TOPO(Invitrogen) following the

Topo TA cloning protocol. 30-60 cell embryo material was provided

by Dr. Richard Davis of City University of New York Graduate

by Dr. Richard pavis of Staten Island, Staten Island, NY
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Bowers,Y., Gibbons,M., Ritter,E., Bennett,J., Franklin,C., Taagareishvill,R., Ronko,I., Kennedy,S., Maguire,L., Beck,C., Underwood,K., Steptoe,M., Allen,M., Person,B., Swaller,T., Harvey,N., Schurk,R., Kohn,S., Shin,T., Jackson,Y., Cardenas,M., McCann,R., Waterston,R. and Wilson,R.

The library was constructed by Claire Murphy and Dr. James McCarte
at Washington University, St. Louis. Oligo(dT)-SL1 PCR based
library. Embryo cDNA PCR products of size >400 nucleotides
containing SL1 on the 5' end and oligo(dT) on the 3' end were
non-directionally cloned into pCRII-DOPO(Invitrogen) following the
Topo TA cloning protocol. 30-60 cell embryo material was provided
by Dr. Richard Davis of City University of New York Graduate
Center, College of Staten Island, Staten Island, NY
(redavis@postbox.csi.cuny.edu). James McCarter
